

Coir Log - 1.5m x 300mm

SKU: CL150030

HEIGER Coir logs are an optimum solution to control sediment runoff and erosion in Australian terrain. Our coconut fiber logs are 100% natural and eco-friendly. The coco coir logs are carefully crafted with a sturdy netting that covers the compressed biodegradable coir. These logs are easily installable and manufactured to last twice as long as any other coir log in the market.

Coir logs are made from coconut coir, the fibrous outer layer of coconuts. These clean coconut fibers are compressed into a cylindrical shape and wrapped in mesh for stability. They act as excellent sediment fences. The mesh allows planting and the coir fibers support vegetation growth. Even after they begin to biodegrade, they provide continuous natural erosion control, giving planted vegetation ample time to take root and establish a natural bank. HEIGER Australia offers premium coir logs, also known as coconut fiber logs, which are the ideal eco-friendly solution for effective erosion control. Made from 100% natural coconut fibers, our coir logs are biodegradable and sustainably sourced, ensuring minimal environmental impact. These durable logs are perfect for stabilizing riverbanks, slopes, and coastal areas while promoting vegetation growth. Easy to install and versatile for various applications, HEIGER Australia coir logs provide a long-lasting solution to erosion problems, helping you maintain soil integrity and foster a healthier environment. We deliver to all of Australia, including major states such as New South Wales, Victoria, Queensland, and Western Australia. Buy coir logs online from HEIGER Australia today and take a step towards sustainable erosion control.

Features

- Unparalleled quality
- Extremely flexible
- Lasts 2X longer
- 100% Biodegradable
- Comparatively higher tensile strength
- Easy installation
- Resistant to rot, decay, and UV light
- Environmentally friendly

Eco-friendly Benefits

- Slows down storm water runoff
- Traps and filters sediment flow
- Returns nutrients to the environment
- Requires no chemical treatment
- High air and water permeability
- Improves seed germination and plant growth
- Facilitates root development
